

**Radiology Services Report (9465848-15/Radiograph Consult - Priority)****Completed 08/28/23 11:48 AM****Patient Name:** Elsa TERESA BORREGO (1251)

<b>Requesting Doctor:</b> [REDACTED]	<b>Species:</b> Feline	<b>Age:</b> 10Yr 6Mo
<b>Gender:</b> Female, Spayed	<b>Breed:</b> Domestic shorthair	<b>Weight:</b> 4.24 Kg

Presenting Complaint: Lameness/Neuro

History: Current clinical complaint (musculoskeletal abnormality/abnormalities), MSK signs (trauma), Current clinical signs/ ortho exam summary (On Saturday, Patient jumped off her cat tree and made a large cry that she was in pain. Patient is walking fine now and E/D well with no V/D/C/S. Owner states that whenever she picks up patient, patient is vocal and when P attempts to jump she vocalizes as if in discomfort.)

Physical Exam: Additional PE findings (PE WNL - P seemingly healthy. No pain elicited on palpation of abdomen. Spinal palpation yielded some vocalization.), T (101.3F/38.5C), P (130), R (20), MM (Pink/Healthy), Patient attitude/demeanor (bright)

Diagnostics: Pending diagnostics (Full blood work panel)

Treatment: Tx Plan (yes), Current treatment plan (Patient is going home with meloxicam for 7 days for pain management and advised client no more jumping and to keep patient rested/quiet. )

Other: Additional information (no)

ABDOMINAL RADIOGRAPHS August 28, 2023: 3 views are included.

FINDINGS: The included musculoskeletal structures are unremarkable. There are no narrowed intervertebral disc spaces or fractures or luxations or signs of irregular bone proliferation or lysis. The surrounding soft tissues are normal. In the abdomen, there is mild gas/fluid distention of a couple segments of small bowel. The spleen is equivocally mildly enlarged. No other significant abnormalities are seen. The stomach is empty. The colon contains normal feces. No radiopaque GI foreign body is seen. Peritoneal serosal detail is within normal limits, there is no evidence of peritoneal fluid or inflammation. There is no mass. The liver, kidneys, and urinary bladder are unremarkable. The included thorax is unremarkable.

**CONCLUSIONS:**

1. Mild gas/fluid dilation of a couple segments of small intestine is likely a normal variation, differentials are enteritis or functional ileus.
2. Equivocal mild splenomegaly, very likely a normal variation/artifact although could indicate congestion, extramedullary hematopoiesis, lymphoid hyperplasia, or neoplasia.

re: Elsa TERESA BORREGO (1251)

(Continued)

3. Otherwise unremarkable exam, no signs of back injuries.

**RECOMMENDATIONS:** If there is any recurrence of the clinical signs despite medical management, consultation with a neurologist and potentially spinal MRI would be recommended. A screening abdominal ultrasound exam would also be justified to rule out any infiltrative/inflammatory change to the intestines and spleen.
